ABSTRACT:

According to the invention, techniques for organizing information from systems in a data warehousing environment are provided. In a particular embodiment, the invention provides an apparatus for analyzing data in at least data source of an enterprise. The apparatus can include a meta model for an enterprise. The enterprise is typically a business activity, but can also be other loci of human activity. A data schema derived from the meta model can also be part of the apparatus. The apparatus can also include a database organized according to the data schema. The apparatus can translate data from a variety of sources to the data schema. The apparatus can incorporate data into the database and perform a variety of analyses on the data in the database.

US-CL-CURRENT: 707/102; 705/10, 707/104.1

CLAIMS:

What is claimed is:

1. A computer-based apparatus for data warehousing, comprising:

a memory; and

a processor, coupled to said memory, said processor operatively disposed to:

select a template from a plurality of pre-defined ones, said templates
embodying a plurality of characteristics of the business;

select at least one of a plurality of customer entities from a plurality of
pre-defined ones to form a focal group of customer entities, said selecting
based upon said template;

define at least one of a plurality of customer transaction entities and at
least one of a plurality of attributes of said customer transaction entities
to form a customized group of customer activity components;

define at least one of a plurality of customer event types in said customer
activity components, wherein said customer event types comprise attributes of
said customer transaction entities in said customer activity components;

select at least one of a plurality of data tables and at least one of a
plurality of attributes of said data tables to form a data schema, wherein
said data schema is a reverse Star data schema;

determine at least one of a plurality of attributes based on data types of
tables of said data source;

determine for said attributes at least one of a plurality of primary keys;

create a <u>data warehouse</u> database from said data schema; and

create at least one of a plurality of data mapping rules, said mapping rules providing translation information for tables and attributes of said data sources to said <u>data warehouse</u>.

2. The apparatus of claim 1 wherein said processor is further disposed to define for said attributes at least one of a plurality of foreign keys.

3. The apparatus of claim 1 wherein said processor is further disposed to define application-specific entities for said customer activity components.

4. The apparatus of claim 3 wherein said processor is further disposed to define at least one of a plurality of attributes for said application-specific entities.

5. The apparatus of claim 1 wherein said data types are determined without user intervention.

6. The apparatus of claim 5 wherein said processor is further disposed to provide to users the capability to make changes to said data types if said users choose not to use the derived ones.

7. The apparatus of claim 1 wherein said processor is further disposed to perform customer purchasing behavior analysis.

8. The apparatus of claim 1 wherein said processor is further disposed to perform customer market segmentation analysis.

9. The apparatus of claim 1 wherein said processor is further disposed to perform customer valuation analysis.

10. The apparatus of claim 1 wherein said processor is further disposed to perform customer churn analysis.

ABSTRACT:

According to the invention, techniques for organizing information from systems in a data warehousing environment are provided. In a particular embodiment, the invention provides a system for analyzing data in at least data source of an enterprise. The system includes a variety of steps, such as a step of providing a meta model for an enterprise. The enterprise is typically a business activity, but can also be other loci of human activity. A step of forming a data schema from the meta model is also part of the system. The system also includes creating a database organized to the data schema. Translating data from a variety of sources to the data schema is also part of the system. A step of incorporating data into the database is part of the system. The system can also include a step of performing analysis on the data in the database. The combination of these steps can organize information in a data warehousing environment.

NAME   CITY   STATE   ZIP CODE   COUNTRY
Chen; Li-Wen   Cupertino   CA

US-CL-CURRENT: 705/10; 707/102, 707/104.1

CLAIMS:

    What is claimed is:

    1. A computer based computer program product for data warehousing, comprising:
    code for selecting a template from a plurality of pre-defined ones, said
    templates embodying a plurality of characteristics of a business; code for
    selecting at least one of a plurality of customer entities from a plurality of
    pre-defined ones to form of focal group of customer entities, said selecting
    based upon said template;, code for defining at least one of a plurality of
    customer transaction entities and at least one of a plurality of attributes of
    said customer transaction entities to form a customized group of customer
    activity components; code for defining at least one of a plurality of customer
    event types in said customer activity components, wherein said customer event
    types comprise attributes of said customer transaction entities in said
    customer activity components; code for selecting at least one of a plurality
    of data tables and at least one of a plurality of attributes of said data
    tables to form a data schema, wherein said data schema is a reverse Star data
    schema; code for determining at least one of a plurality of attributes based
    on data types of tables of said data source; code for determining for said
    attributes at least one of a plurality of primary keys; code for creating a
    data warehouse database from said data schema; and code for creating at least
    one of a plurality of data mapping rules, said mapping rules providing
    translation information for tables and attributes of said data sources to said
    data warehouse.

    2. The computer program product of claim 1 further comprising code for
    defining for said data types at least one of a plurality of foreign keys.

    3. The computer program product of claim 1 further comprising: code for
    defining application-specific entities for said customer activity components.

    4. The computer program product of claim 3 further comprising: code for
    defining at least one of a plurality of attributes for said application-
    specific entities.

5. The computer program product of claim 1 wherein said code for determining said data types is performed automatically.

6. The computer program product of claim 5 further comprising: code for providing to users the capability to make changes to said data types if they choose not to use the automatically derived ones.

ABSTRACT:

According to the invention, techniques for organizing information from systems in a

data warehousing environment are provided. In an exemplary embodiment, the
invention provides a method for analyzing data from one or more data sources of an
enterprise. The method provides a meta-model based technique for modeling the
enterprise data. The enterprise is typically a business activity, but can also be
other loci of human activity. Embodiments according to the invention can translate
data from a variety of sources to particular database schema in order to provide
organization to a data warehousing environment.

US-CL-CURRENT: 705/10; 707/102, 707/104.1

CLAIMS:

     What is claimed is:

     1. A computer based method for data warehousing, comprising:

     selecting a template from a plurality of pre-defined ones, said templates
     embodying a plurality of characteristics of a business;

     selecting at least one of a plurality of customer entities from a plurality of
     pre-defined ones to form of focal group of customer entities, said selecting
     based upon said template;

     defining at least one of a plurality of customer transaction entities and at
     least one of a plurality of attributes of said customer transaction entities
     to form a customized group of customer activity components;

     defining at least one of a plurality of customer event types in said customer
     activity components, wherein said customer event types comprise attributes of
     said customer transaction entities in said customer activity components;

     selecting at least one of a plurality of data tables and at least one of a
     plurality of attributes of said data tables to form a data schema, wherein
     said data schema is a reverse star data schema;

     determining at least one of a plurality of attributes based on data types of
     tables of said data source;

     determining for said attributes at least one of a plurality of primary keys;

     creating a data warehouse database from said data schema; and

creating at least one of a plurality of data mapping rules, said mapping rules providing translation information for tables and attributes of said data sources to said <u>data warehouse</u>.

2. The method of claim 1 further comprising defining for said attributes at least one of a plurality of foreign keys.

3. The method of claim 1 further comprising:

defining application-specific entities for said customer activity components.

4. The method of claim 3 further comprising:

defining at least one of a plurality of attributes for said application-specific entities.

5. The method of claim 1 wherein said deriving said data types is performed automatically.

6. The method of claim 5 further comprising:

providing to users the capability to make changes to said data types if they choose not to use the automatically derived ones.
